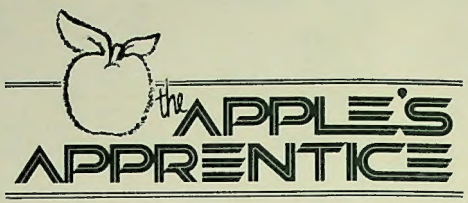
THE FUTURE OF COMPUTERS



Computers are NOT a thing of the future.

Surprised? Don't be, because computers are here **TODAY**, present in areas you may not even be aware of.

From movies to music, schools to science, business to baseball, Apple computers are being used in today's world by forward-thinking people to **CREATE** the future, not just wait for it.

The Apple's Apprentice is the first magazine dedicated to kids that have Apple computers at home or school.

The Apple's Apprentice can help kids learn about today and create tomorrow by showing how Apple computers are used around the world for an amazing variety of applications, and by explaining the secrets of how the computer works with information on programming, computer design and problem solving in general.

Although there are other magazines that address the computer market in general, none offer the kind of direct Apple-related information, created just for kids, that is as current, informative, creative, and just plain fun as **The Apple's Apprentice.**

Throughout the year you can expect to see a fascinating variety of informative articles and features like these:

MAGIGRAPHICS: How to create stunning graphics in your own programs. You'll learn the general principles of computer graphics and animation, with special tips related to the Apple's graphics abilities.

APPRENTICE BASIC: A creative approach to using the language that is built into virtually every microcomputer sold today. BASIC is easy to learn and a good foundation for learning other languages.

THE SOURCEROR'S APPRENTICE: Machine language programs run faster and take up less memory than any other form. Most professional software is written in machine language, and in addition, this form of programming gives you the best insight into how the computer actually works. Each issue will teach more about this method of programming and include a complete source listing for a working machine language program.

ASK THE WIZARD: A special question and answer column where our readers can get special answers to their own computer questions.

CHEAP TRICKS: Helpful hints on things like printer stands, diskette holders, using both sides of a diskette and more that require little or no money to make for yourself or as gifts for others.

PLUS: Interviews with kids making money or learning new careers using their computers, visits with famous people, reviews of computer products including hardware, software and books, games, contests, puzzles, posters, cartoons, stories, seasonal projects and more!

Don't miss this opportunity to add to the enjoyment of your Apple for you and the whole family. Subscribe now to **The Apple's Apprentice** and get substantial savings over the regular newsstand price!

The Apple's Apprentice
